

SECUREAFTER

Introduction (The Problem of Digital Mortality)

In 2026, an average person stores **80-100 password-protected accounts digitally**. They own digital assets worth thousands/lakhs/crores of rupees and store important documents across multiple cloud platforms. Its not only for any persons , same like organizations, Companies.

Yet, the research studies show that **over 70% of adults peoples have no plan** for what happens to these digital assets if they become unconscious, incapacitated, or pass away.

We spend our entire lives to protecting information of our digital data with strong passwords.

But this creates a dangerous situation:

👉 **When the owner is gone, the data is gone too.**

Same as Bank accounts, insurance portals, crypto wallets, emails, investments, medical records, property documents, Identity Proof, Financial, Employee Records, IT & Security and everything locked forever. Not because of hackers, but because **no safe access plan exists for loved ones**.

Basically, what we know about our problem ?

Digital security today is binary:

- **Access**
- **No access**

This works while you are alive.

But after death or incapacity, binary security may become a failure.

The major question is:

- How do I keep my data completely private while I'm alive, but make sure the right people can access it when I'm not ?

Market Problem Analysis.

Password Locked world:

- Email based password reset, Proprietary apps, Legal portals that requiring credentials and many more....

Real world scenarios:

- A family cannot access the insurance document because the document is in an email address account so they can't log into.
- A business partner dies, and no one knows where the incorporation documents are stored.
- A crypto wallet worth lakh is permanently lost because the private key died with its owner. Etc....

Why existing solution fail ?

- **Google drive/Dropbox:** Problem is binary access model either access 100% or 0% . means either you have **Full access or zero access., No identity verification of recipients, No delayed or conditional sharing**
- **Password Managers:** They solve password continuity, not life continuity.
- **Death-related planning**, including funerals and final wishes, is the primary focus of websites like **Everplans and Cake**. Particularly for younger users who are not prepared to consider death, this causes **emotional distress**. Adoption is challenging because of their UI, which feels heavy, serious, and complicated with an excessive number of forms and legal-style steps.
SecureAfter, on the **other hand**, **avoids** being called "death-tech." It treats death as a trigger, not the theme, and concentrates on safe document storage and family protection during life. Because of this, SecureAfter is now straightforward, useful, and simpler for younger users to use.

Objective of the Project

The main objectives of SecureAfter are:

- To securely store the necessary(important) personal documents online
- To allow access to be verified & the trusted nominees only
- To provide the clear emergency instructions/notification(s) to family members
- To ensure privacy while the user is alive and accessibility of documents during emergencies time
- To reduce stress and confusion for loved ones in critical situations

What SecureAfter Really Is ?

SecureAfter is not just a cloud storage like Google Drive, Dropbox, Amazon S3, IDrive, Apple iCloud, Mega etc... only used for storage of any documents but **SecureAfter is a conditional access system**

It is **cold storage with a trigger like system** .

1. When you are alive :->> your data **stays locked** like a fortress
2. When something happens to you :->> Your data will safely become a **bridge** to your trusted people(s).

Major Modules of the System

1. **Authentication Module (Security Gatekeeper)**: Key features includes like OTP verifications, Session Timeout, Audit Logs(Every important action like login, document upload, or deletion is recorded for security purposes.)
2. **Document Vault Module (Secure Storage)**: Can upload documents such as PDFs, images, Doc and Word files, Categorize documents includes : Medical, Financial, Legal, Property, Identity Documents.
One-click **bulk download** of all documents in ZIP format
3. **Nominee Management Module (Trusted Circle)**: Nominee verification using OTP (email and phone), Different access levels: View Only, View & Download, Notes Only
4. **Emergency Instructions Module (Guidebook)**: Text-based emergency notes, medical information's and users can store many sensitive information.
5. **Dashboard Module (Mission Control)**: Overview of total documents and nominees

Technology stack:

Frontend: HTML5, CSS3, Django Templates + Javascript, responsive UI

Backend: Django (Python)

Database: SQLite (development)

Authentication: Django Auth + Custom OTP + Twilio API (for mobile OTP in future)

Video Processing: FFmpeg, Converts uploaded videos into browser-compatible formats

Security Model

Current Security

- HTTPS encryption in transit
- Server-side access control
- CSRF protection
- Session hardening

How our system works ?

Register → Verify OTP → Login → Upload Doc → Add Nominee → Add Instructions → Done

Future Scope of SecureAfter

- AI-Based Smart Document Management (Automatically identify document types)

- Emergency Trigger Automation
- Blockchain for Tamper-Proof Security (Store document access logs immutably, Ensure documents are not modified or deleted illegally , increase trust and transparency)
- Multi-Country Legal Compliance
- Mobile Application (Android & iOS)
- Integration with Banks and Government Services
- Advanced Role-Based Access Control (emergency access only, time limit for access of nominee, legal only and medical only access)
- Business & Enterprise Version (High-net-worth individuals, Hospitals, legal firms, and insurance companies)

Conclusion

Digital legacy management is a delicate but significant issue, and **SecureAfter** is a very useful solution.

The platform guarantees that crucial documents and instructions are never lost and documents are accessible to the right people at the right time by fusing security, usability, and trust.

This project shows a thorough comprehension of:

- Development of websites
- Security principles
- Solving problems in the real world
- Design with the user in mind
